Historic 21-day National Lockdown: March 25

Prime Minister Narendra Modi announced an unprecedented national lockdown for 21 days on Tuesday. (Photo: via PTI)

On **Tuesday March 24th, 2020 evening** India's Prime Minister Narendra Modi announces a 21-day lockdown, noting that it is crucial in India's battle against Covid-19 ([India Today](#)).

Migrant workers walk back to their villages along the Mumbai Pune highway during the lockdown in Mumbai, India © AP

Indian coronavirus lockdown triggers exodus of migrant workers to rural areas ([ft.com](#))

Millions light candles in a collective display of solidarity called for by Prime Minister Narendra Modi ([dw.com](#))

Lockdown simply buys us time

- To ramp up testing, disease surveillance, contact network tracing
- Prepare healthcare infrastructure
- Optimally deploy resources based on emerging hotspots
- Stop the virus: pause and then revive the economy
- Keeping the essential supply chain going and support the vulnerable
- Need long-term strategy: instead of discrete short-term tactics

Had a picket fence

Need to build watch towers, dams, escape boats¹³

Questions that one can pose

- How many cases do we expect to see post lockdown?
- When can we expect to see a decline in fatalities?
- What does a successful lockdown look like?
- How should we return to normalcy from lockdown?

Qualitative comparison - Hubei, China

COVID-19 Confirmed New Cases/Recovered/Deaths by Day in Hubei, China

- And many more in the last few weeks..

SIR model: fundamentals

- **Structure:** Each person is in one of three 'states'.

- **Utility:** Can model transmissions using count data.
- **Challenge:** True proportions unknown!

Facing the challenge: extended SIR

- **Idea:** Introduce a latent Markov process.

eSIR model: hierarchical formulation and solution

$$\frac{d\theta_t^S}{dt} = -\beta\theta_t^S\theta_t^I, \quad \frac{d\theta_t^I}{dt} = \beta\theta_t^S\theta_t^I - \gamma\theta_t^I, \quad \frac{d\theta_t^R}{dt} = \gamma\theta_t^I.$$

Compartmental
Specification

$$Y_t^I | \boldsymbol{\theta}_t, \boldsymbol{\tau} \sim \text{Beta}(\lambda^I \theta_t^I, \lambda^I (1 - \theta_t^I)),$$

$$Y_t^R | \boldsymbol{\theta}_t, \boldsymbol{\tau} \sim \text{Beta}(\lambda^R \theta_t^R, \lambda^R (1 - \theta_t^R)).$$

$$R_{\text{eff}} = \beta / \gamma$$

Building autocorrelation

$$\boldsymbol{\theta}_t | \boldsymbol{\theta}_{t-1}, \boldsymbol{\tau} \sim \text{Dirichlet}(\kappa f(\boldsymbol{\theta}_{t-1}, \beta, \gamma)).$$

- Given the values at the previous step, the system can then be solved for f using approximations.

Prior specifications for Bayesian set-up

- **Latent proportions:** $\theta_0 \sim \text{Dirichlet}(1 - Y_1^I - Y_1^R, Y_1^I, Y_1^R)$, $\theta_0^S = 1 - \theta_0^I - \theta_0^R$.
- **Basic reproduction number:** $R_0 \sim \text{logNormal}(0.582, 0.223)$.
 - Prior mean and sd of R_0 are thus set at **2** and 1, respectively.
- **Removal rate:** $\gamma \sim \text{logNormal}(-2.955, 0.910)$.
 - Prior mean and sd of γ are thus set at **0.082** and 0.1, respectively.
 - Prior average infectious period ($T_\gamma = \frac{1}{\gamma}$) is approx. **12 days**.
- Specifying priors on γ and R_0 eliminates the need for specifying prior on β separately.

Markov chain Monte Carlo (MCMC) algorithm

- Begin with large variances that can be tuned with more data coming in.

$$\kappa, \lambda^I, \lambda^R \sim \text{Gamma}(2, 0.0001) \text{ iid.}$$

- t_0 : last date of data availability; the forecast spans over the period $[t_0 + 1, T]$.

- **Algorithm:**

- 0. Take M draws from the posterior $[\boldsymbol{\theta}_{1:t_0}, \boldsymbol{\tau} | \mathbf{Y}_{1:t_0}]$.
- 1. For each solution path $m \in \{1, \dots, M\}$, iterate between the following two steps via MCMC.
 - i. Draw $\boldsymbol{\theta}_t^{(m)}$ from $[\boldsymbol{\theta}_t | \boldsymbol{\theta}_{t-1}^{(m-1)}, \boldsymbol{\tau}^{(m)}], t \in \{t_0 + 1, \dots, T\}$.
 - ii. Draw $\mathbf{Y}_t^{(m)}$ from $[\mathbf{Y}_t | \boldsymbol{\theta}_t^{(m)}, \boldsymbol{\tau}^{(m)}], t \in \{t_0 + 1, \dots, T\}$.

Daily Prevalence

Modeling interventions

$$\frac{d\theta_t^S}{dt} = -\beta\pi(t)\theta_t^S\theta_t^I, \quad \frac{d\theta_t^I}{dt} = \beta\pi(t)\theta_t^S\theta_t^I - \gamma\theta_t^I, \quad \frac{d\theta_t^R}{dt} = \gamma\theta_t^I.$$

Forecasting scenarios and assumptions

- No intervention
- Social distancing and travel ban (without lockdown)

Post-lockdown

- 21-day lockdown with gradual resumption of activities at different levels:
 - Moderate
 - Cautious
 - Normal (pre-intervention)

-India has since extended the lockdown from 21- to 40- and then 55-days

R₀ over time

a. R₀ over time by scenario

Short term

Cumulative COVID-19 cases by day in India
as of 14 April 2020; quick adherence

	April 30 estimate	Upper limit
No intervention	221,977	1,432,841
Social distancing	52,972	328,718
Lockdown (moderate)	19,625	130,326

Observed 4/30: 34,866

© COV-IND-19 Study Group

Long term projection and forecasting scenarios

b. Predicted number of new COVID-19 cases in India under hypothetical scenarios

as of 14 April 2020; quick adherence

© COV-IND-19 Study Group

Lockdown duration - incidence

b. Predicted number of daily COVID-19 infections under varying lockdown lengths as of 14 April, 2020; quick adherence

Sensitivity analyses

- Under-reporting (10x number of observed cases)
- Case-clustering (use metro population instead of nationwide)
- Vary prior for R_0
 - Prior mean for $R_0 = 2$
 - Prior mean for $R_0 = 3$
 - Prior mean for $R_0 = 4$

Sensitivity analyses

Table 2. Comparison of estimated projections and posterior estimates of model parameters across different sensitivity analysis scenarios under 21-day lockdown with moderate return, using observed data till April 14. Prior SD for R_0 is 1.0.

Sensitivity Analysis	Predictions		Posterior Estimates		
	May 1	May 15	R_0	β	γ
Under-reporting*	25,248 [104,411]	62,797 [343,465]	2.28 [1.05, 4.20]	0.20 [0.05, 0.39]	0.09 [0.03, 0.19]
Case-clustering**	24,818 [59,525]	57,499 [189,010]	2.81 [1.47, 4.70]	0.16 [0.07, 0.26]	0.06 [0.03, 0.10]
Prior mean for $R_0 = 2$	20,251 [135,034]	42,252 [315,348]	1.80 [0.87, 3.26]	0.27 [0.06, 0.59]	0.16 [0.04, 0.35]
Prior mean for $R_0 = 3$	25,757 [165,287]	86,750 [638,770]	2.43 [1.41, 4.07]	0.30 [0.09, 0.60]	0.13 [0.04, 0.30]
Prior mean for $R_0 = 4$	34,587 [213,556]	253,935 [1,854,319]	3.38 [2.09, 5.27]	0.32 [0.10, 0.63]	0.10 [0.03, 0.23]

* Observed case-counts are multiplied by 10, Prior mean for $R_0 = 2$

** Assume that the cases happen in metro hotspots, use population size $N=32$ million instead of national population 1.34 billion, Prior mean for $R_0 = 2$

Updating projections

- How does observing new data impact our model projections?
- Use observed counts up until
 - April 1
 - April 7
 - April 14

Source: <https://www.google.com/covid19/mobility/>

Moving Forward...

- Public has a serious role in public health. Community participation will be necessary and key. We need to manage risk in our daily lives.
- Use of data (mobile network, hospital admissions, temperature maps) to chase the epidemic and nip it in the bud
- Nimble policymaking (pause, push and drive) in a data adaptive way.
- Track daily death and admissions data compare to history.
- Use data to estimate need, deploy resources, how many beds, PPE, ICU beds, ventilators are needed and where?

The tale of two disciplines: Economics versus(?) Public Health in the crisis of virus in India

On being human in the face of a pandemic

Nature Cancer (2020) | [Cite this article](#)

30 Altmetric | [Metrics](#)

As the COVID-19 pandemic sweeps through the world, we must reassess the principles that guide our individual and collective responses and the way we operate in society. In the face of crisis, we must lead with science and humanity.
